Assignment - 7

Name - Shivendu Mishra
Roll Number - 200123050
email id - m.shivendu@iitg.ac.in

Question - 1

In order to calculate the price of the European call and Put option in the classical Black Scholes Merton framework, we use the below formulae for the call option price:-

$$C(t, s) = sN(d_1) - ke^{-r\tau}N(d_2)$$

$$d_1 = \frac{1}{\sigma\sqrt{\tau}} \left(\log\left(\frac{s}{k}\right) + (r + \sigma^2/2)\tau \right)$$

$$d_2 = d_1 - \sigma\sqrt{\tau}$$

$$\tau = T - t$$

Now from the above relations we can calculate the price of a European Call option in the classical BSM framework. For put option we use the put-call parity:-

$$C(t, s) - P(t, s) = s - Ke^{-r\tau}$$

I implemented the below formulae in my program and calculated the price of a European call and put option in the classical BSM framework. The parameters chosen were as follows:-

$$t = 0, s = 1, k = 1, \sigma = 0.6, r = 0.05, T = 1$$

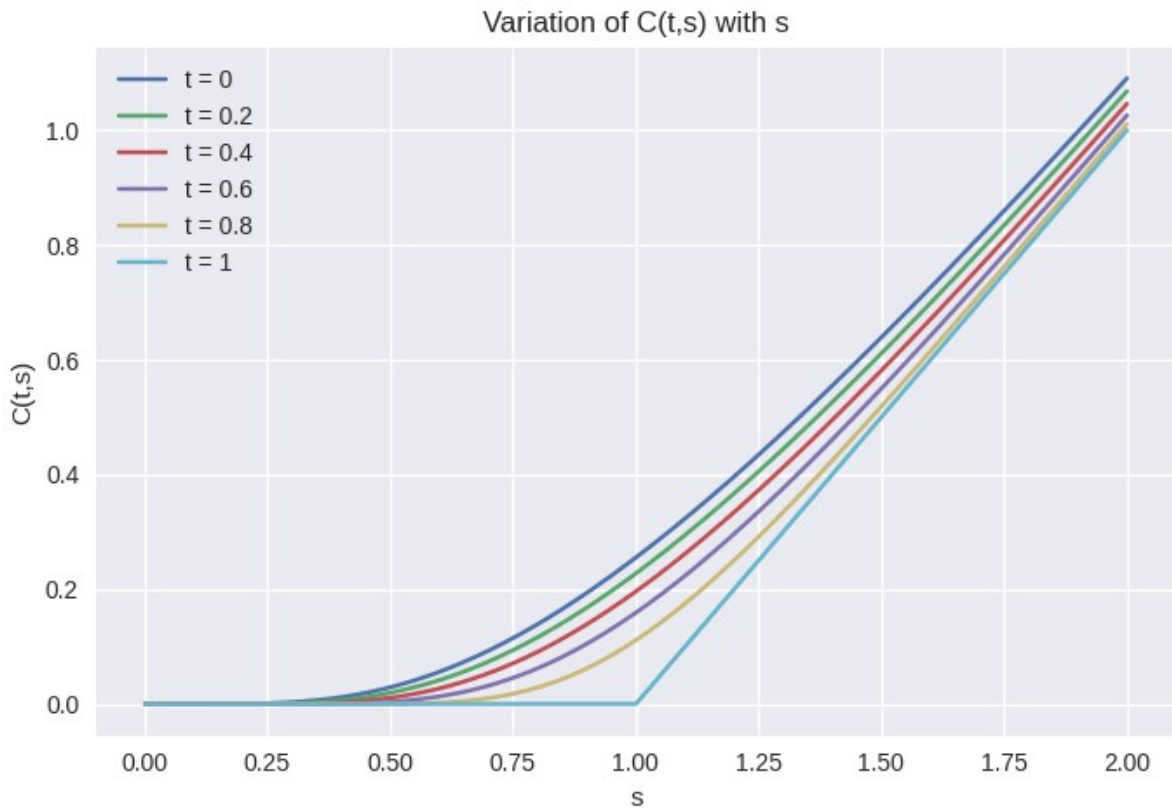

The price of European Call and Put option were as follows:-

$$C(t, s) = 0.255232$$

$$P(t, s) = 0.206461$$

Question - 2

Plot of $C(t,s)$ as a function of t alone for given values of t

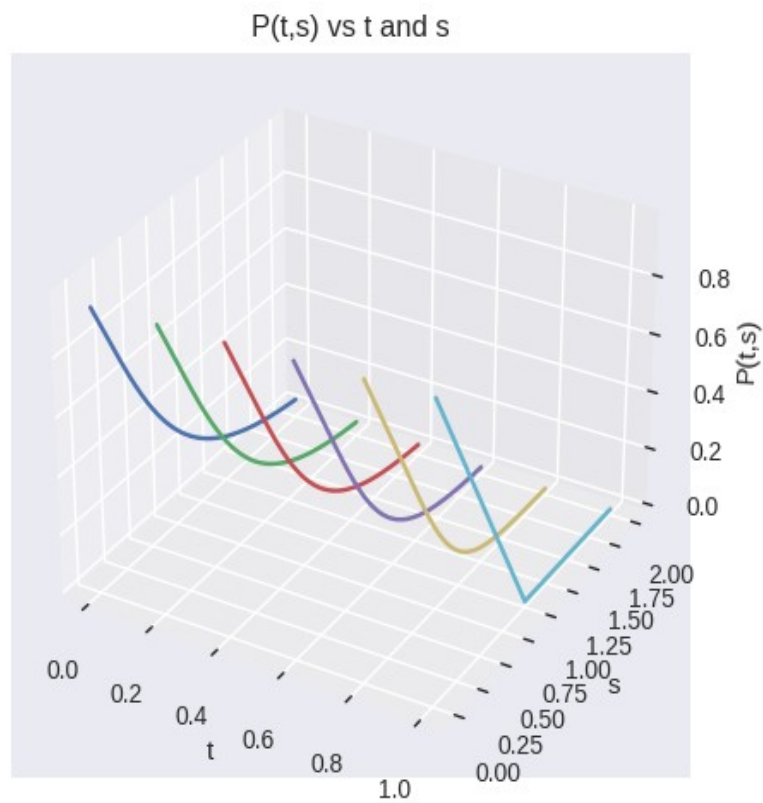

Plot of $P(t,s)$ as a function of t alone for given values of t

Plot of $C(t,s)$ as a function of t alone for given values of t (3D)

Plot of $P(t,s)$ as a function of t alone for given values of t (3D)

Question - 3

$C(t,s)$ as a smooth surface over t,s plane

$P(t,s)$ vs t and s

$P(t,s)$ as a smooth surface over t,s plane

$P(t,s)$ vs t and s

Question - 4

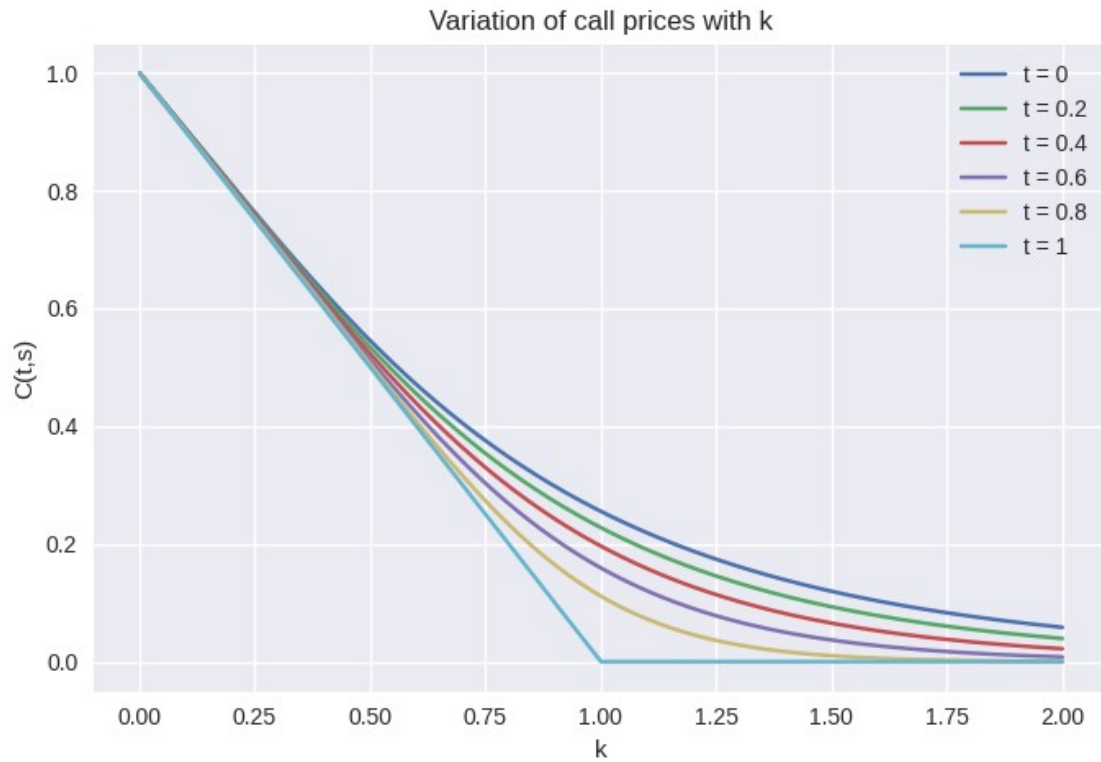

Plot of $C(t,s)$ with k for different values of s

Plot of $P(t,s)$ with k for different values of s

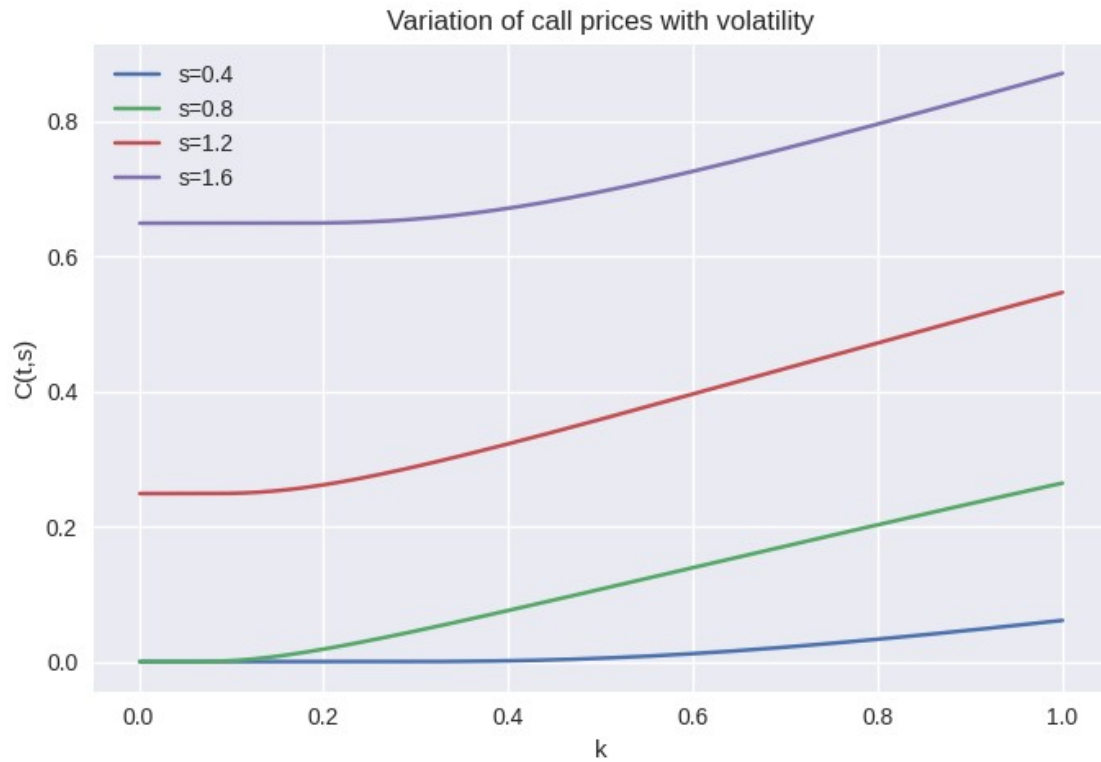

Plot of $C(t,s)$ with k for different values of t

Plot of $P(t,s)$ with k for different values of t

Plot of $C(t,s)$ with σ for different values of s

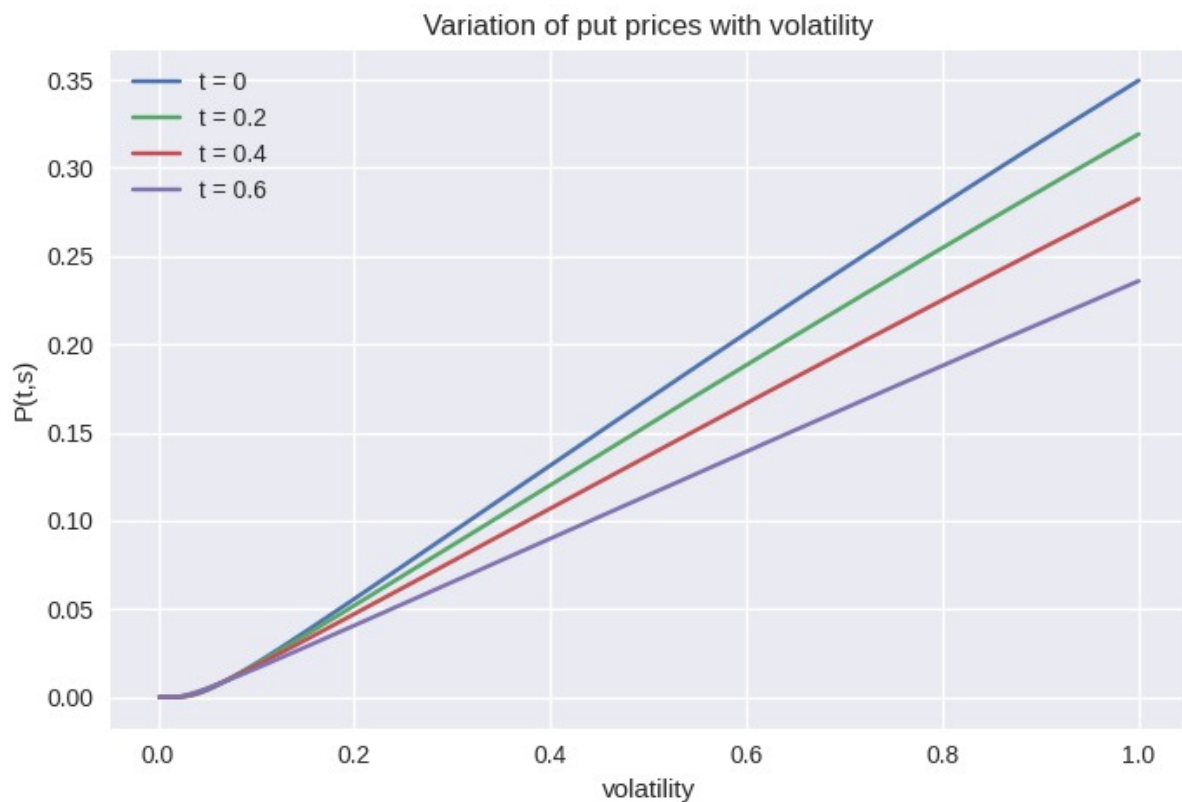

Plot of $P(t,s)$ with σ for different values of s

Plot of $C(t,s)$ with σ for different values of t

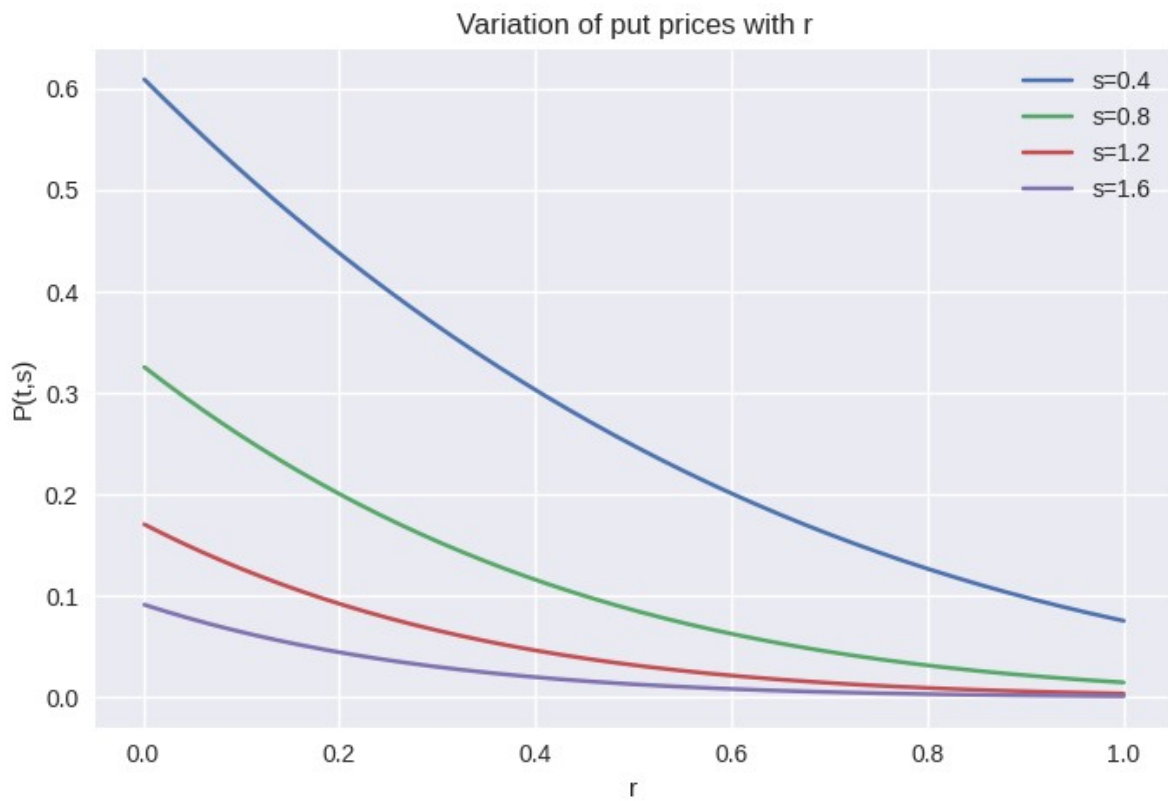

Plot of $P(t,s)$ with σ for different values of t

Plot of $C(t,s)$ with r for different values of s

Plot of $P(t,s)$ with r for different values of s

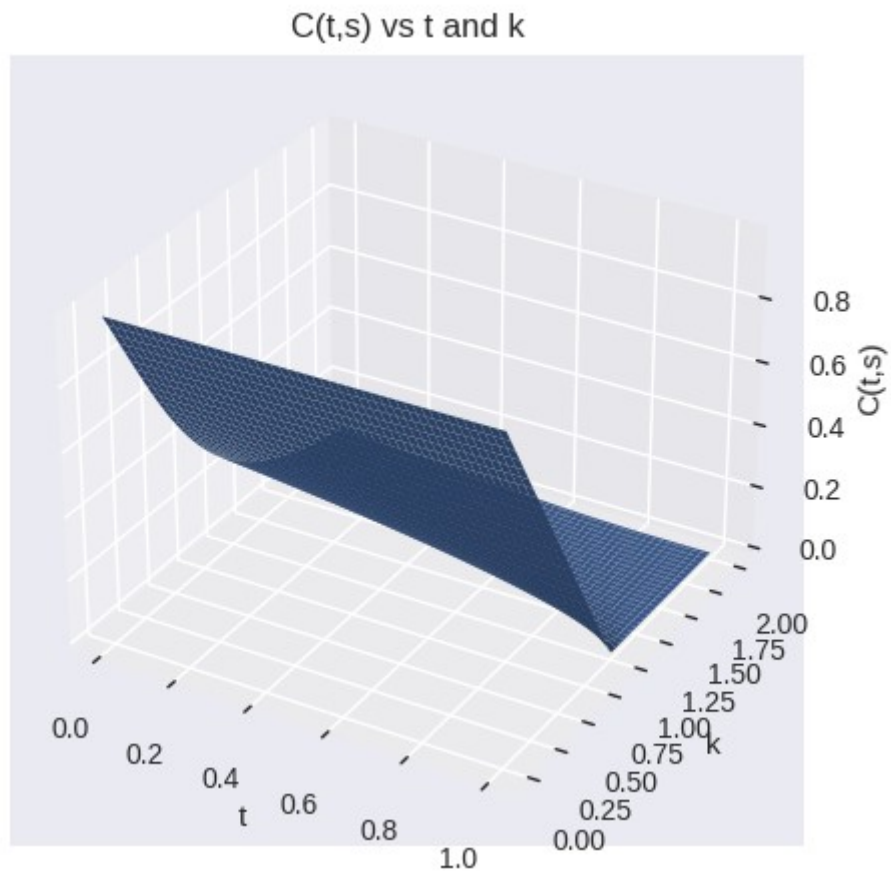

Plot of $C(t,s)$ with r for different values of t

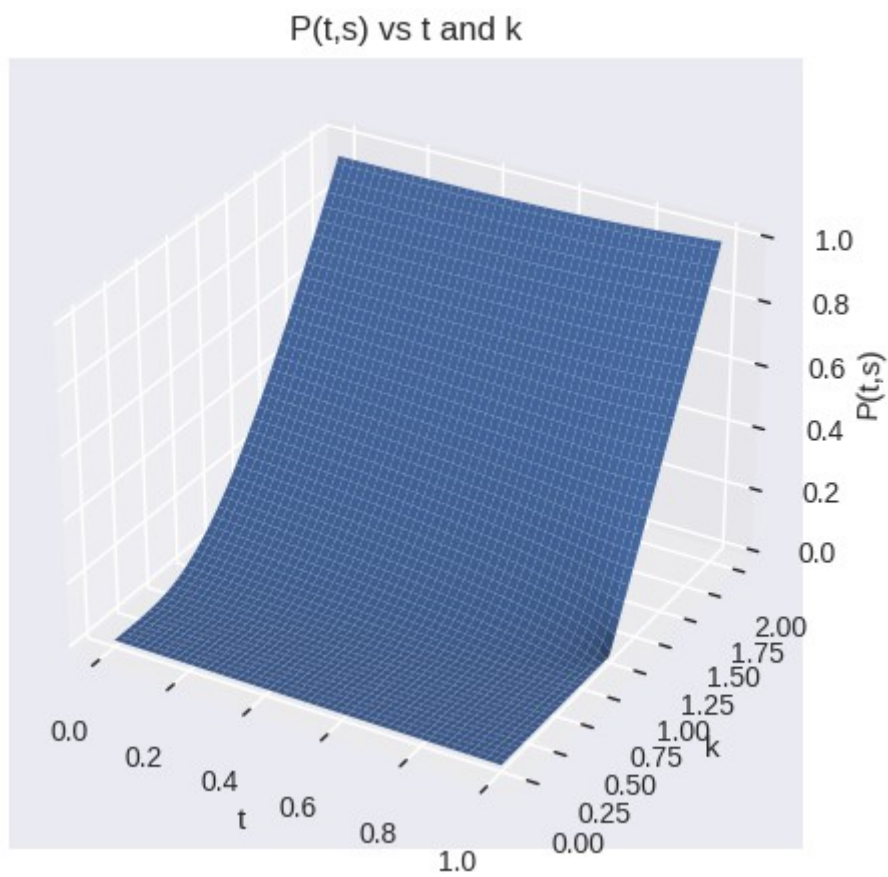

Plot of $P(t,s)$ with r for different values of t

Surface plot of $C(t,s)$ vs t and k

Surface plot of $P(t,s)$ vs t and k

Surface plot of $C(t,s)$ vs t and σ

$C(t,s)$ vs t and volatility

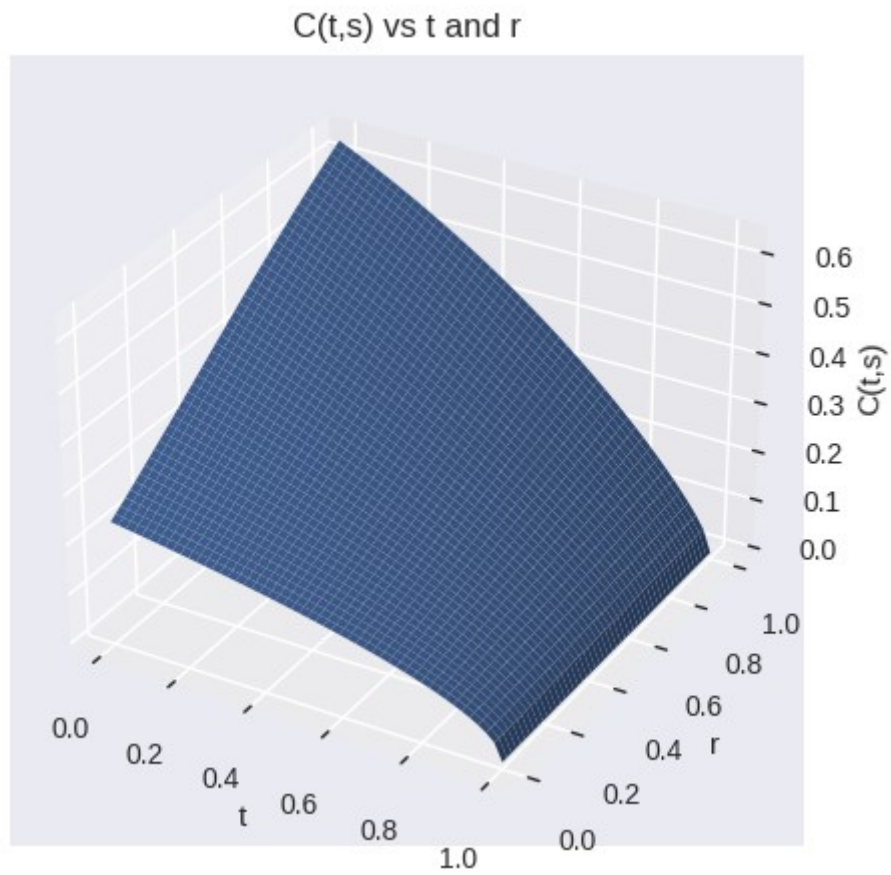

Surface plot of $P(t,s)$ vs t and σ

$P(t,s)$ vs t and volatility

Surface plot of $C(t,s)$ vs t and r

Surface plot of $P(t,s)$ vs t and r

Surface plot of $C(t,s)$ vs t and T

$C(t,s)$ vs t and T

Surface plot of $P(t,s)$ vs t and T

$P(t,s)$ vs t and T

Surface plot of $C(t,s)$ vs s and k

$C(t,s)$ vs s and k

Surface plot of $P(t,s)$ vs s and k

$P(t,s)$ vs s and k

Surface plot of $C(t,s)$ vs s and σ
 $C(t,s)$ vs s and volatility

Surface plot of $P(t,s)$ vs s and σ

$P(t,s)$ vs s and volatility

Surface plot of $C(t,s)$ vs s and r

$C(t,s)$ vs s and r

Surface plot of $P(t,s)$ vs s and r

$P(t,s)$ vs s and r

Surface plot of $C(t,s)$ vs s and T

$C(t,s)$ vs s and T

Surface plot of $P(t,s)$ vs s and T

$P(t,s)$ vs s and T

Surface plot of $C(t,s)$ vs k and σ

$C(t,s)$ vs k and volatility

Surface plot of $P(t,s)$ vs k and σ

$P(t,s)$ vs k and volatility

Surface plot of $C(t,s)$ vs k and r

$C(t,s)$ vs k and r

Surface plot of $P(t,s)$ vs k and r

$P(t,s)$ vs k and r

Surface plot of $C(t,s)$ vs k and T

$C(t,s)$ vs k and T

Surface plot of $P(t,s)$ vs k and T

$P(t,s)$ vs k and T

Surface plot of $C(t,s)$ vs σ and r

$C(t,s)$ vs volatility and r

Surface plot of $P(t,s)$ vs σ and r

$P(t,s)$ vs volatility and r

Surface plot of $C(t,s)$ vs σ and T

$C(t,s)$ vs volatility and T

Surface plot of $P(t,s)$ vs σ and T

$P(t,s)$ vs volatility and T

Surface plot of $C(t,s)$ vs r and T

$C(t,s)$ vs r and T

Surface plot of $P(t,s)$ vs r and T

$P(t,s)$ vs r and T

Tabulation of values

Table of prices with respect to different values of k :

	k	$C(t,s)$	$P(t,s)$
0	0.001000	0.399049	3.794708e-18
1	0.040988	0.361012	8.680143e-07
2	0.200940	0.217333	8.472773e-03

9	0.900280	0.604385	0.010840

Question - 5 Incorporating Dividends

In order to incorporate dividends in the analysis, I considered the stock to be such that it pays dividends at a rate of α continuously. According to the classical BSM setup the formulae for call and put option in this case would be:-

$$C(t, s) = se^{-\alpha\tau} N(d_1) - ke^{-r\tau} N(d_2)$$

$$d_1 = \frac{1}{\sigma\sqrt{\tau}} \left(\log\left(\frac{s}{k}\right) + (r - \alpha + \sigma^2/2)\tau \right)$$

$$d_2 = d_1 - \sigma\sqrt{\tau}$$

$$\tau = T - t$$

Now from the above relations we can calculate the price of a European Call option in the classical BSM framework. For put option we use the put-call parity:-

$$C(t, s) - P(t, s) = se^{-\alpha\tau} - Ke^{-r\tau}$$

I implemented the below formulae in my program and calculated the price of a European call and put option in the classical BSM framework. The parameters chosen were as follows:-

$$t = 0, s = 1, k = 1, \sigma = 0.6, r = 0.05, T = 1$$

Now, I repeated question 4 of the previous problem and did sensitivity analysis of $C(t, s)$ and $P(t, s)$. In this case I also did sensitivity analysis with respect to the parameter α . I took the value of α to be $\alpha = 0.3$
